$d = 8$, California
$d = 20$, synthetic data
$d = 50$, synthetic data
Faith–Shap, computed exactly: not feasible
Shapley–Taylor, computed exactly: not feasible
Faith–Shap, computed exactly: not feasible
time to explain N instances (s)
instances explained, N
surrogate model: fit, then dividends at $\mathbf{x}$ and interpolation
ALE of order ≤ 2: fit, then readings by interpolation
Shapley–Taylor, computed exactly
Faith–Shap, computed exactly
Shapley–Taylor, permutation sampling, two permutations
Faith–Shap, sampled weighted regression, $2d + 2048$ evaluations
KernelSHAP, default budget of $2d + 2048$ evaluations
TreeSHAP-IQ, Shapley–Taylor, exact for tree ensembles
